

Will today's science always be true?

*Pete says:*

*'There are some scientific theories that we aren't sure about, because there's not enough evidence yet.*

*But some theories we know must be true. These include:*

- The liver cleans the blood.*
- Dinosaurs existed millions of years ago.*
- Bacteria and viruses exist.'*

*We should be careful about which theories we trust. Sometimes scientists can be confident about something before all of the evidence is in.*

*Which scientific theories today do you think are definitely true, and which might be wrong?*

What do you think?
